**AMENDMENTS TO THE CLAIMS:** 

This listing of claims replaces all prior versions and listings of claims in the application.

**Listing of claims:** 

Claim 1 (Currently Amended): A service providing system comprising:

a service providing apparatus in which organic information of the user is previously registered in correspondence to ID information, ID information and organic information based on an authentication demand of the user are inputted, the registered organic information corresponding to the inputted ID information is read out and collated, and when they coincide,

use of the apparatus is permitted; and

an illegal access discriminating apparatus for discriminating an illegal access by an

attacker to said service providing apparatus, wherein

said illegal access discriminating apparatus comprises:

a storing unit for inputting and storing the ID information and organic information

inputted by said-service providing apparatus on the basis of the authentication demand of the

user;

an inputting and storing unit for inputting and temporarily storing the ID information and

organic information based on the authentication demand which said service providing system

received from the user,

a use information storing unit for storing ID information and organic information based

on the authentication demand which the service providing system received in the past from the

user within a predetermined time;

a comparing and collating unit for comparing and collating the latest inputted ID

information and organic information with ID information and organic information stored which

were inputted and not previously registered in the past; and

a control unit for discriminating an authentication demand by the attacker on the basis of

an output of said comparing and collating unit and notifying said service providing apparatus of

it.

Claim 2 (Cancelled).

Claim 3 (Original): An apparatus according to claim 1, wherein said control unit

determines that there is the authentication demand by the illegal access person in the case where

the ID information does not coincide and the organic information coincides or the case where the

ID information coincides and the organic information does not coincide on the basis of the output

of said comparing and collating unit.

Claim 4 (Original): An apparatus according to claim 1, wherein said storing unit stores a

telephone number serving as a transmitting source, a terminal position such as a network address,

and an input time in correspondence to the ID information and organic information which were

inputted in the past, and

said control unit determines that there is the authentication demand by the illegal access

person in the case where the comparison result by said comparing and collating unit between the

within a predetermined time indicates dissidence.

Claim 5 (Original): An apparatus according to claim 1, wherein said control unit

discriminates whether the past ID information has a serial number for the inputted ID

information or not and, when it is determined that the past ID information has the serial number,

said control unit determines that there is the authentication demand by the illegal access person at

a predetermined designated number of times.

Claim 6 (Original): An apparatus according to claim 1, wherein when the inputted

organic information and the organic information which was inputted in the past coincide, said

control unit detects a combination in which the organic information coincides and the ID

information differs, and when the number of said combinations reaches a predetermined number,

said control unit determines that there is the authentication demand by the illegal access person.

Claim 7 (Original): An apparatus according to claim 1, wherein said comparing and

collating unit comprises:

an ID information comparing unit for comparing the inputted ID information and the ID

information which was inputted in the past and generating a signal indicative of coincidence or

dissidence; and

an organic information collating unit for comparing the inputted organic information and

the organic information which was inputted in the past, generating a signal indicative of

coincidence of the organic information in the case where a value of a predetermined coincidence

degree or more is obtained, and generating a signal indicative of dissidence of the organic

information in the case where a value less than said predetermined coincidence degree is

obtained.

Claim 8 (Original): An apparatus according to claim 1, further comprising a timer unit

for measuring a time, and wherein the ID information and organic information which were

inputted in the past after the elapse of a predetermined time from the storage on the basis of time

information measured by said timer unit are erased and excluded from targets of the comparison

and collation.

Claim 9 (Original): An apparatus according to claim 1, wherein

said storing unit stores a telephone number serving as a transmitting source and a terminal

position such as a network address or the like together with the ID information and organic

information which were inputted in the past, and

said comparing and collating unit compares and collates the inputted ID information and

organic information with the ID information and organic information which were inputted in the

past from a same terminal position.

Claim 10 (Original): An apparatus according to claim 1, further comprising:

an authentication demand terminal address recording unit for recording the number of

times of authentication demand every terminal address; and

a same terminal access detecting unit for detecting that the authentication demand of a

predetermined number or more has been performed within a predetermined time with reference

to said authentication demand terminal address, activating said comparing and collating unit and

said control unit, and allowing an illegal access to be discriminated.

Claim 11 (Original): An apparatus according to claim 1, wherein when it is determined

that there is the authentication demand by the illegal access person, said control unit

automatically notifies an administrator of the service providing system of a result of said

discrimination.

Claim 12 (Currently Amended): An illegal access discriminating method comprising:

a service providing step of previously registering organic information of the user in

correspondence to ID information, inputting ID information and organic information based on an

authentication demand of the user reading out the registered organic information corresponding

to the inputted ID information and collating, and when they coincide, permitting use of the

apparatus; and

an illegal access discriminating step of discriminating an illegal access by an attacker to

said service providing apparatus, wherein

said illegal access discriminating step comprises:

a storing step of inputting and storing the ID information and organic information based

on the authentication demand which said service providing apparatus received from the user;

an inputting and storing step of inputting and temporarily storing the ID information and

organic information based on the authentication demand which said service providing system

received in the past from the user,

a use information storing step of storing ID information and organic information based on

the authentication demand which the service providing system received in the past from the user;

a comparing and collating step of comparing and collating the latest inputted ID

information and organic information with ID information and organic information which were

inputted and not previously registered in the past; and

a control step of discriminating an authentication demand by an illegal access person on

the basis of an output in said comparing and collating step and notifying said service providing

apparatus of it.

Claim 13 (Cancelled).

Claim 14 (Original): A method according to claim 12, wherein in said control step, it is

determined that there is the authentication demand by the illegal access person in the case where

the ID information does not coincide and the organic information coincides or the case where the

ID information coincides and the organic information does not coincide on the basis of the output

in said comparing and collating step.

Claim 15 (Original): A method according to claim 12, wherein

in said storing step, a telephone number serving as a transmitting source, a terminal

position such as a network address, and an input time in correspondence to the ID information

and organic information which were inputted in the past are stored, and

in said control step, it is determined that there is the authentication demand by the illegal

access person in the case where the comparison result in said comparing and collating step

between the inputted ID information and the past ID information inputted from a same terminal

position within a predetermined time indicates dissidence.

Claim 16 (Original): A method according to claim 12, wherein in said control step,

whether the past ID information has a serial number for the inputted ID information or not is

discriminated and, when it is determined that the past ID information has the serial number, it is

determined that there is the authentication demand by the illegal access person at a predetermined

designated number of times.

Claim 17 (Original): A method according to claim 12, wherein in said control step, when

the inputted organic information and the organic information which was inputted in the past

coincide, a combination in which the organic information coincides and the ID information

differs is detected, and when the number of said combinations reaches a predetermined number,

it is determined that there is the authentication demand by the illegal access person.

Claim 18 (Original): A method according to claim 12, wherein said comparing and

collating step comprises:

an ID information comparing step of comparing the inputted ID information and the ID

information which was inputted in the past and generating a signal indicative of coincidence or

dissidence; and

an organic information collating step of comparing the inputted organic information and

the organic information which was inputted in the past, generating a signal indicative of

coincidence of the organic information in the case where a value of a predetermined coincidence

degree or more is obtained, and generating a signal indicative of dissidence of the organic

information in the case where a value less than said predetermined coincidence degree is

obtained.

Claim 19 (Original): A method according to claim 12, further comprising a timer step of

measuring a time, and wherein the ID information and organic information which were inputted

in the past after the elapse of a predetermined time from the storage on the basis of time

information measured in said timer step are erased and excluded from targets of the comparison

and collation.

Claim 20 (Original): A method according to claim 12, wherein

in said storing step, a telephone number serving as a transmitting source and a terminal

position such as a network address or the like are stored together with the ID information and

organic information which were inputted in the past, and

in said comparing and collating step, the inputted ID information and organic information

with the ID information and organic information which were inputted in the past from a same

terminal position are compared and collated.

Claim 21 (Original): A method according to claim 12, further comprising:

an authentication demand terminal address recording step of recording the number of

times of authentication demand every terminal address; and

a same terminal access detecting step of detecting that the authentication demand of a

predetermined number or more has been performed within a predetermined time with reference

to said authentication demand terminal address, activating said comparing and collating step and

said control step, and allowing an illegal access to be discriminated.

Claim 22 (Original): A method according to claim 12, wherein in said control step, when

it is determined that there is the authentication demand by the illegal access person, a result of

said discrimination is automatically notified to an administrator of the service providing system.
